The **Flexible Solution** for Your Teaching Needs

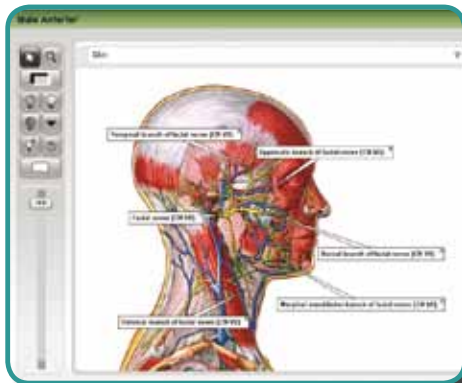

A virtual cadaver always on-call

Peer-reviewed by a team of leading anatomists from around the world, A.D.A.M. Interactive Anatomy is the most comprehensive online resource of detailed anatomical images available. Illustrated fully-dissectible male and female bodies and precision point-and-click identification of over 20,000 anatomical structures makes AIA the most accurate anatomy resource you can find.

View and compare structures from different perspectives

Dissect through the human body, peeling away structures, layer-by-layer in anterior, posterior, lateral, or medial views with our easy-to-navigate scroll bar. Open images in multiple windows simultaneously to compare structures from different views.

Multiple structure identification and manipulation

Simultaneously identify, highlight, display, and extract multiple anatomical structures and physiological systems. This capability makes it possible for your students to explore the boundaries of structures, viewing them in isolation, and then viewing in context with the surrounding anatomy.

Customizable transparency box

Easily move, resize, and reveal areas of underlying dissectible anatomy in real time with our customizable transparency box. This valuable tool will help your students easily comprehend the spatial relationships between adjacent structures and surrounding organs.

Eliminate complex software installations and IT support requirements.

Guide Students Through the Human Body Outside the Lab

Prosections out of the lab and at your fingertips

AIA's Atlas Anatomy includes over 500 meticulously detailed full-color illustrations of body parts, organs, structures, and systems complete with pin and label capabilities. Not only do you get access to the highest-quality anatomy illustrations available, but you also receive pinned cadaver prosections photographs from actual dissections and radiographic images.

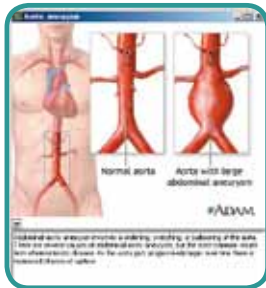

You can also customize hundreds of valuable images and pre-pinned structures available in AIA's Atlas Anatomy. Add and remove an unlimited number of pins, hide and show structure name boxes, and add your pins and structure names with our annotation tool.

Aid your students in their self study by simulating your lab prosection exercises using the pins available in the Atlas.
